

Course: CEH

Date Assigned: 12-10-2025

Due Date: 13-10-2025

Student Name: Praveen Kumar

Batch/Section: Super30 Batch

Instructor: Nitish kumar

Summary

The PDF is a concise practical guide to *active reconnaissance* as taught in the TryHackMe lab. It explains what active recon is, how it differs from passive recon, and walks through a hands-on workflow for discovering and enumerating targets using commonly available tools. The document is aimed at learners who want a structured approach to finding live hosts, open services, and useful attack surface details.

Active Reconnaissance lab

Active Reconnaissance involves direct interacting with the target to gather information. With this type of attack, it can be sure that you will be detected once you Recon the target directly since it involves sending requests to the target discovering vulnerabilities.

Active Reconnaissance requires using tools such as:

- 1. Port-Scanning** to scan opened ports and version that can be used as an advantage
- 2. Network Mapping** uses traceroute to scan the map out of network's target infrastructure since the packet you sent can be received by Routers, even Switches.
- 3. Ping Sweeps** sends ICMP (Internet Control Message Protocol) echo requests. But multiple IP address are being received an ICMP to discover hosts that are active on the network.
- 4. Social Engineering** now this type could also have Active Reconnaissance. One of the examples is engaging conversation to the certain target. You want them to give what they own (usually, accounts like emails or any social accounts. Knowing what company are they associated to or likely network infrastructure or any information that you think it can be used as advantage to your target)

The screenshot shows the TryHackMe platform interface. At the top, there is a navigation bar with icons for 'Try Hack Me', 'Dashboard', 'Learn', 'Practice', and 'Compete'. On the right side of the top bar are buttons for 'Access Machines', a search bar, a notifications icon (with 3 notifications), a 'Go Premium' button, and a user profile icon. Below the top bar, the main content area has a dark background with a red and black abstract graphic on the right. The title 'Active Reconnaissance' is displayed in large white text. Below the title, a description reads: 'Learn how to use simple tools such as traceroute, ping, telnet, and a web browser to gather information.' There are several small icons next to the text: a gear, a person, a clock, and a document. Below this, there are buttons for 'Share your achievement', 'Start AttackBox', 'Save Room', '3405 Recommend', and 'Options'. A progress bar at the bottom indicates 'Room completed (100%)'. In the bottom left corner, there is a task card titled 'Task 1' with a green checkmark and the sub-task 'Introduction'. The task description starts with: 'In the first room of the Network Security Module, we focused on [passive reconnaissance](#). In this second room, we focus on active reconnaissance and the essential tools related to it. We learn to use a web browser to collect more information about our target. Moreover, we discuss using simple tools such as `ping`, `traceroute`, `telnet`, and `nc` to gather information about the network, system, and services.'

In this room, we focus on active reconnaissance. Active reconnaissance begins with direct connections made to the target machine. Any such connection might leave information in the logs showing the client IP address, time of the connection, and duration of the connection, among other things. However, not all connections are suspicious. It is possible to let your active reconnaissance appear as regular client activity. Consider web browsing; no one would suspect a browser connected to a target web server among hundreds of other legitimate users. You can use such techniques to your advantage when working as part of the red team (attackers) and don't want to alarm the blue team (defenders).

In this room, we go through various tools commonly bundled with most operating systems or easily obtainable. We begin with the web browser and its built-in developer tools; furthermore, we show you how a web browser can be "armed" to become an efficient reconnaissance framework. Afterwards, we discuss other benign tools such as `ping`, `traceroute`, and `telnet`. All these programs require connection to the target, and hence our activities would fall under active reconnaissance.

This room is of interest to anyone who wants to become familiar with essential tools and see how they can use them in active reconnaissance. The web browser developer tools might take some effort to gain familiarity, although it offers a graphical user interface. The command-line tools covered are relatively straightforward to use.

Important Notice: Please note that if you're not subscribed, the AttackBox won't have Internet access, so you will need to use the VPN to complete the questions that require Internet access.

Answer the questions below

Ensure that you understand why these tools fall under active reconnaissance. Launch your AttackBox and ensure that it is ready. You will need it to answer the questions, especially in later tasks.

No answer needed ✓ Correct Answer

Task 2 Web Browser

Task 2. Web browsers

In the TryHackMe, the lecture focuses on Active Reconnaissance one of the first activity is about Web Browsers.

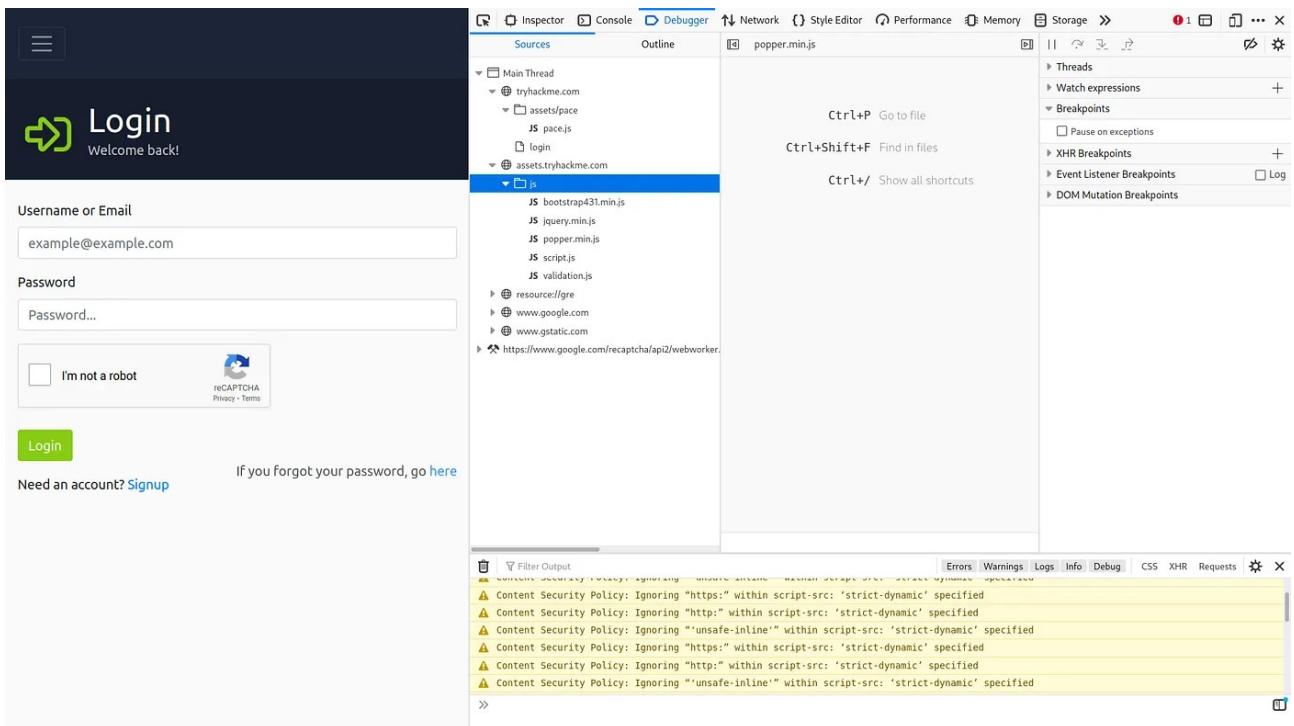

Web browser can be used to gather information about a target.

Browsers can access websites by connecting to **HTTP** or **HTTPS**. It is a type of Application that establishes connection to a server hosting website. Users connects to a:

TCP 80 by default when the website is accessed over **HTTP**.

TCP 443 by default when the website is accessed over **HTTPS**.

While browsing a web page, you can press **Ctrl +Shift + I** on a PC to open the Developer Tools on Web Browsers.

Developer Tools lets you inspect many things that your browser has received and exchanged with the remote server. For instance, you can view and even modify JavaScript (JS) files, inspect cookies set on your system and discover folder structure of the site content.

Plenty add-ons for Firefox and Chrome that can help in penetration testing. Here are a few examples:

FoxyProxy lets you quickly change the proxy server you are using to access the target website. convenient when using Burpsuite or if you need to switch proxy servers regularly.

User-Agent Switcher and Manager gives you the ability to pretend to be accessing the webpage from a different operating system or different web browser.

Wappalyzer provides insights about the technologies used on the visited websites.

 **Wappalyzer**

After reading the Lectures there is a questions that needed to answer.

The question is:

Browse to the following website and ensure that you have opened your Developer Tools on AttackBox Firefox, or the browser on your computer. Using the Developer Tools, figure out the total number of questions.

The **following website** from the question is clickable

It lead me to another website

Since the question requires me to use Developer Tools to figure out the total number of questions on the script.js

Our goal is to figure out the total number of questions.

Here are the steps:

1. First click the hyperlinked on following website and directs you to another page
2. The website involves Javascript so I pressed CTRL + SHIFT + I then the Developer Tools appears on the right side
3. Go to Sources and you'll see a hierarchy files you can easily locate the script.js (this tells on the hint)
4. The script.js has some following function codes.

```
let step = 1;
let questions = {
  1 : {
    'speaking' : 'alice',
    'answer_1' : 'SYN : Can you hear me Bob?',
    'answer_2' : 'FIN : Goodbye',
    'answer_3' : 'ACK : Erm... What?',
    'answer' : 1
  },
  2 : {
    'speaking' : 'bob',
    'answer_1' : 'RST : Cya Later',
    'answer_2' : 'PING : 77',
    'answer_3' : 'SYN/ACK : Yes, I can hear you!',
    'answer' : 3
  },
  3 : {
    'speaking' : 'alice',
    'answer_1' : 'FAIL : SEGMENTATION FAULT',
    'answer_2' : 'ACK : Okay Great',
    'answer_3' : 'SYN : x = 3?',
    'answer' : 2
  },
  4 : {
    'speaking' : 'alice',
    'answer_1' : 'ICMP : 99',
    'answer_2' : 'SYN : Yes, I can hear you!',
    'answer_3' : 'DATA : Cheesecake is on sale!',
    'answer' : 3
  },
  5 : {
    'speaking' : 'bob',
    'answer_1' : 'ACK : I Hear ya!'
  }
}
```

By counting the number of questions you'll just count the number of sequence questions. The number of questions is total of 8.

Answer the questions below

Browse to the [following website](#) and ensure that you have opened your Developer Tools on AttackBox Firefox, or the browser on your computer. Using the Developer Tools, figure out the total number of questions.

8

✓ Correct Answer

✗ Hint

Task 3. Ping

One of the most common tools in troubleshooting in Networking is the ping. The ping simply just sends a packet message to the host machine sending ICMP echo request to know if the host is online, if the host receives an echo request it should also send a reply to that request telling you

that the host is online. If the host doesn't receive your ping, it will display on your command prompt "**Requested Time out**" as it means that the host is unavailable.

In this activity Tryhackme has some box that I can test with the ping. It requires me to connect to OpenVPN so I downloaded the config file and import it to my application.

The IP Address of the machine shows up on the above the content.

Title	Target IP Address	Expires	?	Add 1 hour	Terminate
NetSecMod Room 02 telnet-badr (savagenj)	10.10.7.125	57min 35s			

What I need to try is to ping the IP address using ping and using some parameter -n (on Windows) and specify how many counts of ping.

```
Microsoft Windows [Version 10.0.22621.4037]

Answer is 26 hops to every routers

Task 5. Telnet

This protocol is used to connect to a remote host via command line interface (CLI). The port that it uses is 23, though the client with its simplicity can be used for other purposes. Knowing that telnet client relies on the TCP protocol, you can use Telnet to connect to any service like Port 80.

The command to use is `telnet <ip address> <port number>`

Answer questions below

Start the attached VM from Task 3 if it is not already started. On the AttackBox, open the terminal and use the telnet client to connect to the VM on port 80. What is the name of the running server?

Answer is Apache

What is the version of the running server (on port 80 of the VM)?

Answer is 2.4.61

THM AttackBox 55min 25s

Task 6. Netcat

A different applications that can be of great value to a pentester. It supports TCP and UDP protocols. It can function as a client that connects to a listening port but also can act as server that listens on a port of your choice.

Answer the questions below

Start the VM and open the AttackBox. Once the AttackBox loads, use Netcat to connect to the VM port 21. What is the version of the running server?

The command is `nc <ip address> <port-number>`

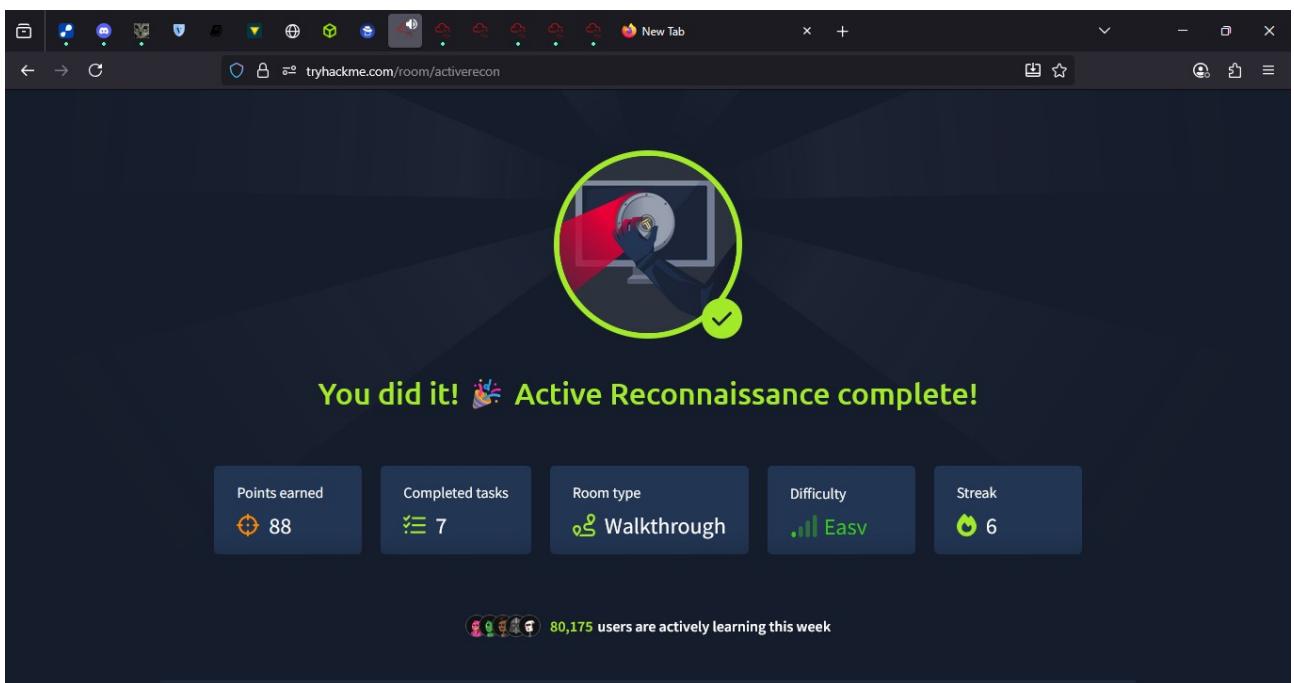

```
(kali㉿kali)-[~] $ nc 10.10.93.44 21 options: explicit-exit-notification 3
220 debra2.thm.local FTP server (Version 6.4/OpenBSD/Linux-ftp-0.17) ready.
```

The screenshot shows the TryHackMe platform. On the left, a browser window displays a room progress bar at 92% completion. The room content discusses using Netcat to echo input through a TCP tunnel. A question asks for the server version, with the answer '0.17' marked as correct. Below this is a section for recommending the room, with a scale from 1 to 9. On the right, a terminal window titled 'AttackBox' shows a root shell with the message '1/7 Rooms completed! Levelling up in progress...'. The terminal command 'root@ip-10-201-57-30:~#' is visible. The bottom status bar indicates '48min 32s'.

Task 7 Putting it all together

This task is all about application of all the commands that I have learned from all the topics from Task 1–6. These are the tools that can be used to interact with the host machine:

Command	Example
ping	<code>ping -c 10 10.10.234.174</code> on Linux or macOS
ping	<code>ping -n 10 10.10.234.174</code> on MS Windows
traceroute	<code>traceroute 10.10.234.174</code> on Linux or macOS
tracert	<code>tracert 10.10.234.174</code> on MS Windows
telnet	<code>telnet 10.10.234.174 PORT_NUMBER</code>
netcat as client	<code>nc 10.10.234.174 PORT_NUMBER</code>
netcat as server	<code>nc -lvp PORT_NUMBER</code>

Lessons Learned

This room highlighted the power of passive reconnaissance in gathering comprehensive target intelligence without triggering alarms. Public databases and search engines can expose a wealth of actionable information. The key is thorough documentation and cross-verification of data to build a solid target profile for subsequent phases.

Declaration

I declare that this work is my own and completed without unauthorized assistance.
